

Project Proposal:

Project Title: Elevator Control System (Simulation of a Lift System)

Concept:

A logic-based elevator that moves between 4 floors and stops when a request is received.

Components:

Up/Down Counter (Represents floor movement)
Multiplexer (MUX) (To select floor requests)
State Machine (For movement logic)
Flip-Flops (To store current floor position)

Working:

The elevator moves UP or DOWN based on user input.
If a request is made on floor 2, the elevator stops at floor 2.
